Over the last few years, rotational moulding has emerged as the process of choice for many designers within the furniture industry.

The process can create objects that can be lit, coloured and, if necessary, come complete with threaded inserts that are fitted during the production phase.

Surface finish can be varied on the same component, and materials can be rigid or flexible depending on final requirements.

Good design and tooling of the highest standards ensure that the final product is manufactured with an emphasis of quality and finish not normally associated with the rotational moulding process.

If we have an urgent requirement, Rototek will do all that they can to help us achieve it.
